## 2 Basic Methods for OCR

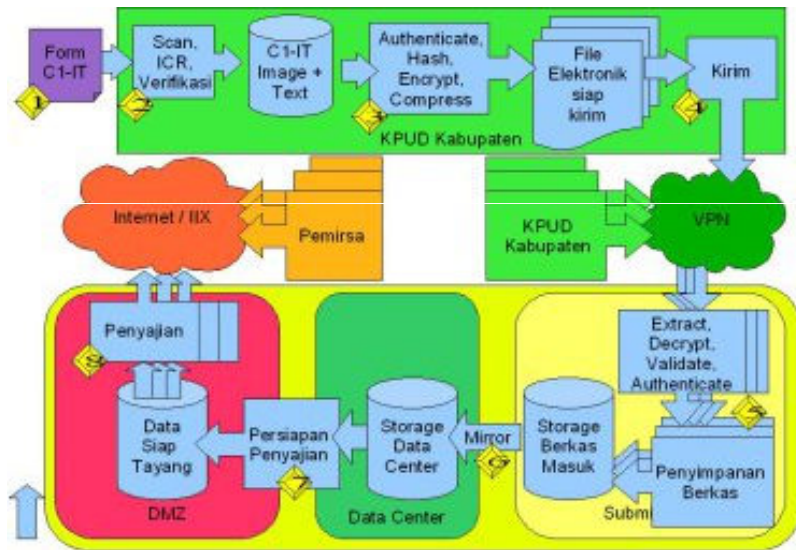

- Matrix matching
  - compares what the OCR scanner sees as a character with a library of character matrices or templates
- Feature extraction
  - computer looks for general features such as open areas, closed shapes, diagonal lines, line intersections, etc
  - a.k.a Intelligent Character Recognition (ICR), or Topological Feature Analysis

# Post-processing

- OCR accuracy can be increased if the output is constrained by a lexicon - a list of words that are allowed to occur in a document.
- "Near-neighbor analysis"
  - "Washington, DOC." → "Washington, D.C."
- Knowledge of the grammar

# Intelligent Character Recognition

- Kasus: Pemilu 2009

### Text to Voice 1.10

by ViJo

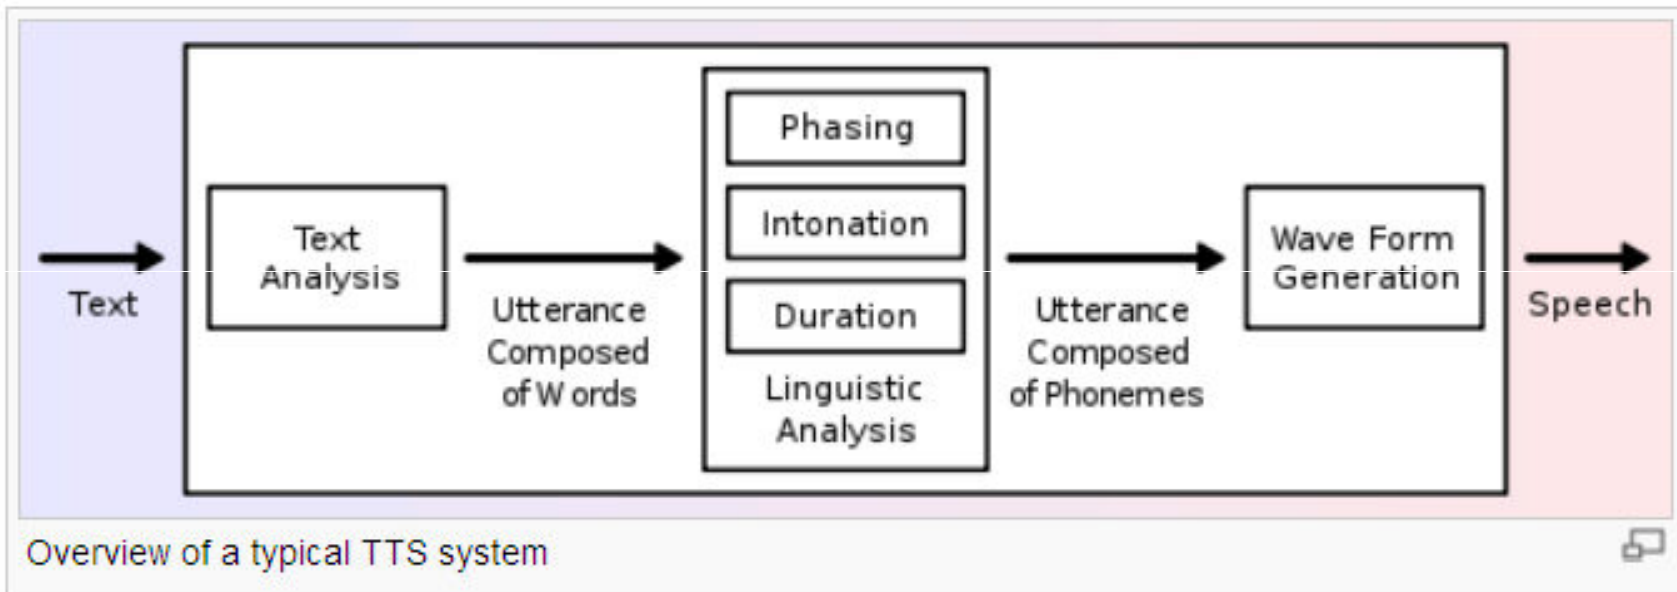

<http://en.wikipedia.org/wiki/Text-to-voice>. TTS gives Firefox the power of speech. Select text, click the button on the bottom right of Firefox window and this add-on speaks the selected text for you. Isn't it brilliant? Audio is downloadable.

### The specifications of IndoTTS

- Receive sentence or paragraph (multiple sentence) input
- Dynamic Indonesian Intonations
- Direct output to Soundcard
- Using High Quality Diphone Concatenation Technology
- Using Indonesian Diphone Database (free for non-commercial use only)
- Supported by updatable database that contain 2500 entries to spell "e" in Indonesian
- Program interface for Borland Delphi, Visual Basic and C++.

# Speech To Text

- Automatic Speech Recognition (ASR)
- The elements of the pipeline are:
  - Transform the PCM digital audio into a better acoustic representation
  - Apply a "grammar" so the speech recognizer knows what phonemes to expect.
    - A grammar could be anything from a context-free grammar to full-blown English.
  - Figure out which phonemes are spoken.
  - Convert the phonemes into words.
